9. Appendix
10. References

1. Background

AAA Northeast is one of the regional clubs comprising the American Automobile Association. AAA Northeast covers Rhode Island, Connecticut, Massachusetts and portions of New York and New Jersey. The American Automobile Association has 58 million members in the US and Canada. They offer services such as roadside assistance, maps and various other financial services.

Roadside assistance is a costly benefit, particularly towing. AAA NE would like to understand drivers behind roadside service and costs. AAA also would like to segment their members that will enable them to extend other financial services.

Dataset - AAA NE has provided the dataset of customers predominantly from Rhode Island and Connecticut. Data consists emergency road side events. Each event has critical information about the household, member and type of incident.

Problem Statement:

1. AAA NE would like to understand what contributes to high ERS costs. Use the roadside data to make recommendations to increase revenue and reduce costs. Make predictions of roadside usage and costs for the next 12 months.
2. In spite of having large customer base for Roadside services, AAA NE doesn't seem to have similar market penetration of their other services e.g. credit card, mortgage, insurance. Analyse current customer data and predict the probability of buying these products.
3. AAA NE would like to perform market segmentation of their members to understand consumer behaviours and accordingly make business decisions.

2. Objectives

Provide a market segmentation of AAA members (or member households) that allows AAA Northeast to better serve their members. They would use this analysis to:

Better anticipate the needs of members.

Customize communications and offering to various segments.

Expend more effort driving acquisition and renewal of desirable members

3. Methodology

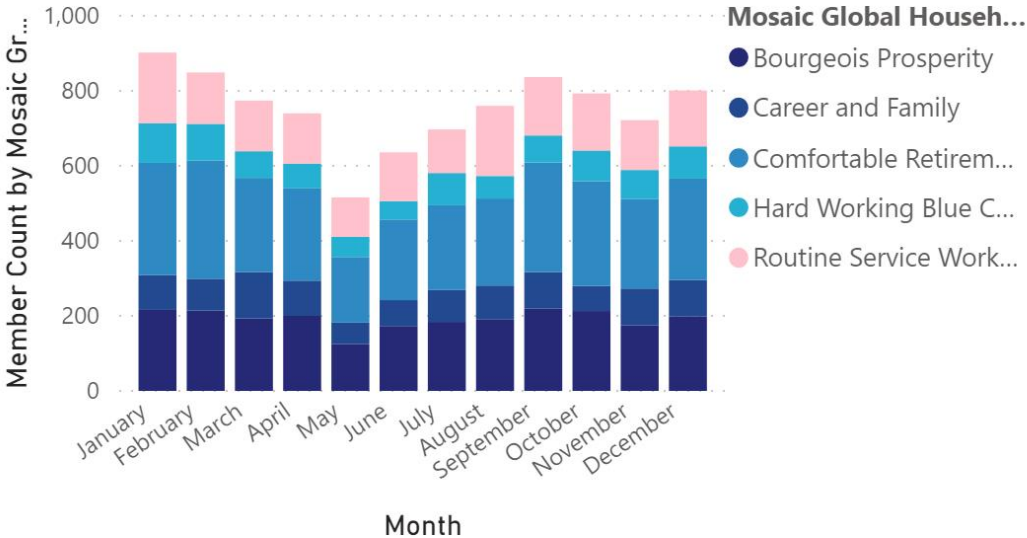

1. Data Cleansing and Exploratory Data Analysis.
 2. Understand dimensions that drive revenue and costs.
 3. Feature Engineering.
 4. Predictive Model Building.
 1. Logistic Regression Model.
 2. Gradient Boosting Regression Model.
 5. Use K-Means Clustering for Segmentation.
 6. Analyse findings and make recommendations.
- **Logistic Regression Model** – Simple model to predict binary output. Ensemble method were tested too.
 - **Gradient Boosting** - is a method of converting a set of weak learners into strong learners by optimising the loss function.
 - **K-Means Clustering** – most popular clustering method. It partitions data into k clusters using mean distances.

4. Exploratory Data Analysis

1. Explore data features
2. Process member data for null values and outliers.
3. Select the most features relevant for model.
4. Summarise the data at a household level.
5. Feature Engineering
 1. Use findings from the household level data.
 2. Use correlation matrix to understand correlation between features.
 3. Use OneHot and Label Encoding to deal with binary and multi-categorical data.

Exploratory Data Analysis

ERS Calls by Month & Mosaic Group

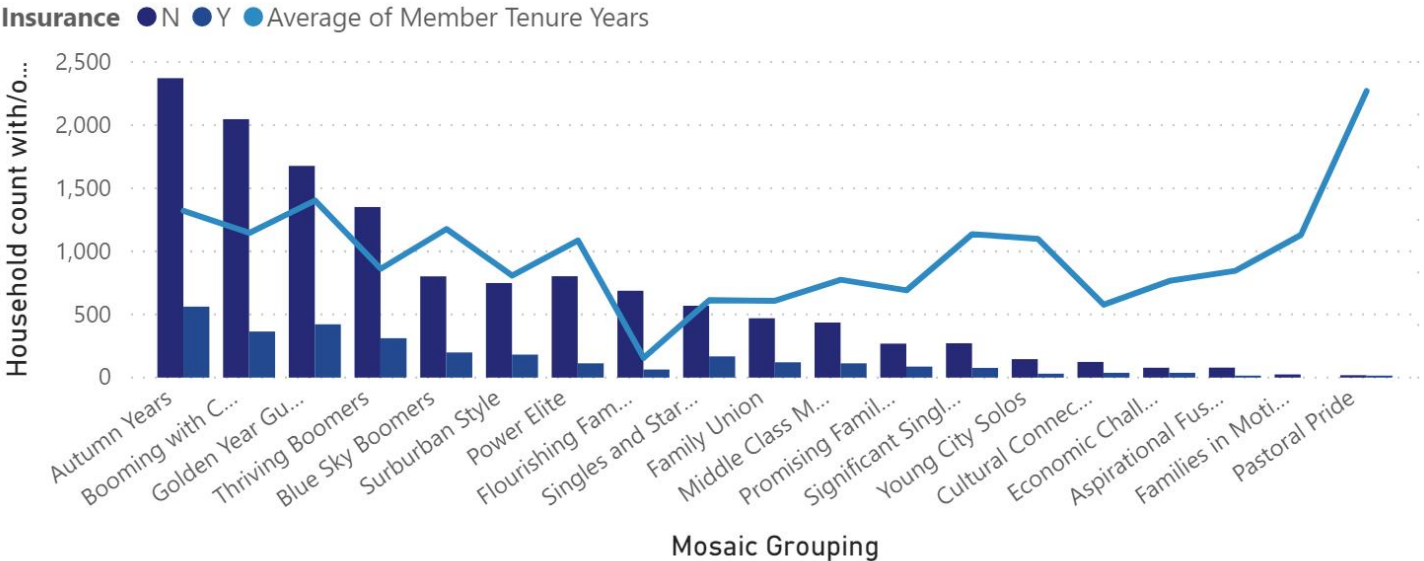

Providence Weather - Monthly

Findings

1. Elderly members seem to need ERS more.
2. Severe weather conditions is a major contributor.
3. Aged and Middle Aged Family with long tenure are more likely to buy other financial services.
4. Towing, Battery Service and Flat Tire are major cost contributors.

Member Engagement with Insurance

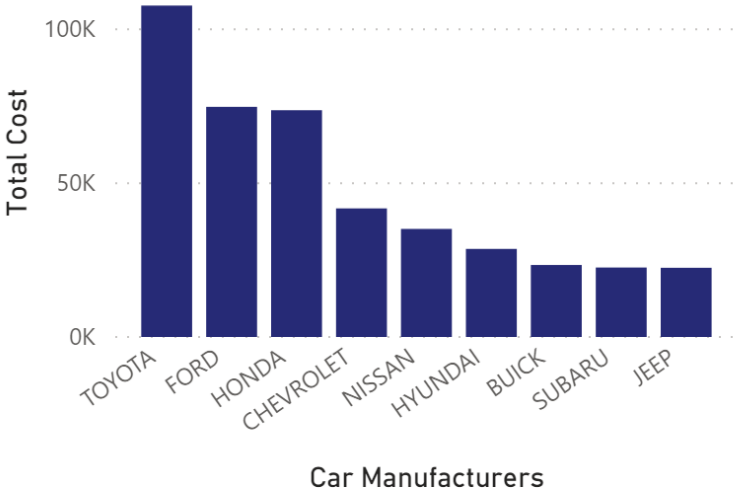

ERS Category and Costs

Exploratory Data Analysis

Total Costs by Car Manufacturers

ERS Calls by Year & Category

Findings

1. Toyota, Honda and Ford vehicles tend to need ERS more often.
2. Towing and Battery service calls are consistently high across 5 years.
3. 75% of occupation data is missing.
4. Financial and other insurance service products are not very popular among AAA NE members.

Members by Occupation Code

Membership type by Household

| Insurance | By Household |
|-----------|--------------|
| N | 4854 |
| Y | 1441 |
| Total | 5241 |

| Credit Card | By Household |
|-------------|--------------|
| N | 5099 |
| Y | 578 |
| Total | 5241 |

| CMSI | By Household |
|-------|--------------|
| N | 5197 |
| Y | 368 |
| Total | 5241 |

| Travel | By Household |
|--------|--------------|
| N | 5051 |
| Y | 731 |
| Total | 5241 |

5. Predict Probability of Purchase

Model Setup

- Imbalanced dataset – Logistic Regression model built using 50/50 split.
- Probabilities calculated for Credit Card, Insurance, CMSI and Travel services.
- Validation data set was used to score resulting model.
- Predicted probabilities were used for Segmentation

Model Evaluation

The model accurately predicted a probability 60% of the time.

6. Predict Roadside Usage and Costs

Model Setup

- Data Cleansing, Feature Engineering applied and Correlation matrix used.
- Gradient Boosting Regressor Model Built and improved with RFCEV, GridSearch.
- Predicted values were compared with the original values. (Refer to Appendix)
- Other Regressor models were tested.
- Predicted Values were used for Segmentation.

Model Evaluation

Model Accuracy = 99.85%

7. Market Segmentation Overview

| Cluster 0 | Cluster 1 | Cluster 2 | Cluster 3 |
|---|---|---|---|
| ★ \$52 <i>Per HH</i> | \$11 <i>Per HH</i> | \$291 <i>Per HH</i> | \$128 <i>Per HH</i> |
| <ul style="list-style-type: none">• Ave Tenure – 35 years• Earns \$50K or more• ERS – Tow & Battery Service• May buy insurance services• Basic Members – 50%★ • Autumn Years & Booming with Confidence | <ul style="list-style-type: none">• Ave Tenure – 38 years• Earns \$70K or more• ERS –Battery & Tow Service• Less probable to buy other services• Mostly Basic Members• Golden Guardians & Autumn Years | <ul style="list-style-type: none">• Ave Tenure – 26 years• Earns \$90K or more• ERS – Tow & Battery Service• Probable to buy insurance services• Plus Member – 67%• Autumn Years & Booming with Confidence | <ul style="list-style-type: none">• Ave Tenure – 30 years• Earns 90K or more• ERS –Tow & Battery Service• Probable to buy other services• Even spread - Basic & Plus Members• Autumn Years & Booming with Confidence |

Overall Clusters

Household by Membership type

Experian Mosaic Grouping

Household Income

Cluster Trend - Predicted Costs vs No. of Household

Predicted Probability (Average)

Market Segmentation

Model Setup

- Data Cleansing and Feature Engineering applied.
- Predicted roadside usage, costs and probability of purchase were used for clustering.
- K-Mean Clustering used to build the model.
- Elbow method used for selecting no. of clusters.
- Intercluster distances validated using Yellow bricks frameworks.

Cluster Selection

Clusters = 4

8. Key Recommendations

Members in Cluster 3 with Basic Member Category generate less revenue and drive more costs. Target these members to upgrade to Plus or Premium membership. Offer bundled FSV Services.

Cluster 1 represent 54% of total households. These members are most loyal with long tenure, low ERS costs and bring in more revenue. Great opportunity for AAA NE to capitalise this segment by extending other services.

Relative mix of Middle Aged and Retirees in Cluster 2 seem to over-use ERS with Average Predicted costs of \$291 per household. Send App reminders to service their vehicles, check tires, battery and wiper blades.

FSV and Insurance products are not very popular with members. Quick online research suggests these products are not very competitive and members are less aware of these products. Use the segmentation to educate members and offer these products.

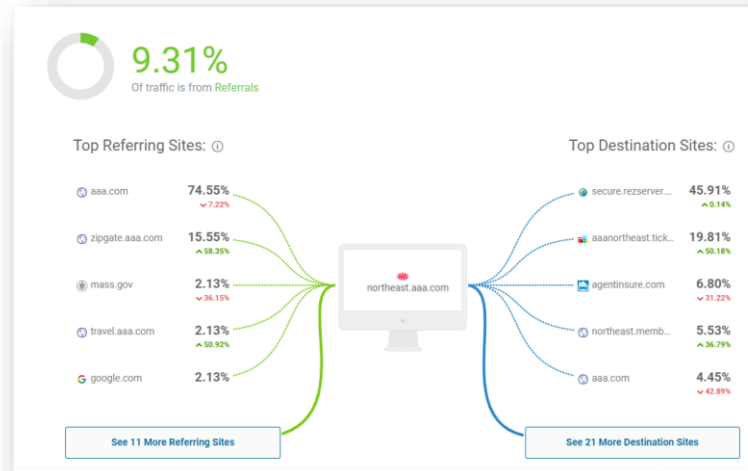

Severe weather conditions has major impact on ERS volume. Drive costs down by educating the members to get their vehicles ready for wild weather.

Bundle Insurance products with memberships. Use NPS score, customer feedback and surveys to better understand customer needs.

Improve Digital Engagement Strategy

- AAA NE may need to review their digital media strategy.
- Increase social media presence across various channels to increase engagement.
- AAA NE website has 48% bounce rate. Website forces viewers to enter zip code before one could access any information. Website should have common landing page and should subtly request zip code.
- Increase member satisfaction by improving digital experiences.
